

# SKINCOL<sup>®</sup>

SUCRALFATE

# Sucralfate

Sucralfate was originally used for the treatment of gastric and duodenal ulcers, now for several years is used for topical wound in skin and mucosa wounds.

*(Brian K Yeh and al. Structural Basis for Activation of Fibroblast Growth Factor Signaling by Sucrose Octasulfate. Molecular and Cellular Biology, October 2002, p7184-7192, Vol 22, N° 20.)*

## What is Sucralfate:

It is a salt of aluminum hydroxide and sucrose octasulfate .

It acts locally increasing tissue resistance by increasing angiogenesis and granulation tissue formation due to association with growth factors

# WOUND HEALING

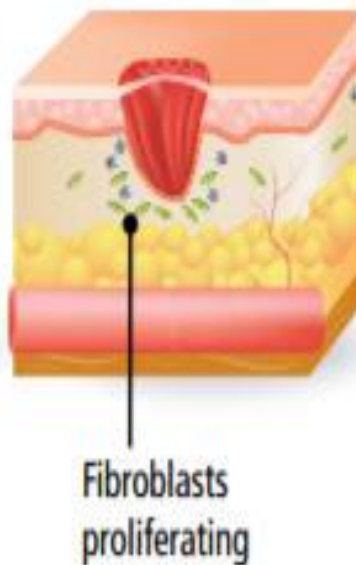

## Bleeding

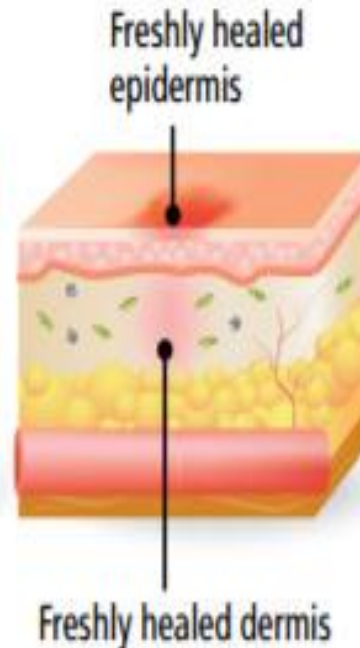

## Inflammation

## Proliferation

## Remodeling

Healthy wound healing involves fibroblasts, the main connective tissue cells present in the body, and macrophages, which form in response to infection.

*The ingredients of skincol when they come into contact with the epithelium (skin) that is damaged, or it is superficial or deeper, create a protective barrier (forming a film) on the wounded area, accelerating the healing process with the mechanism of action that has the sucralfate*

Let's not forget

SKINCOL is the unique world patented formulation, containing sucralfate 25% for dermal use which may be used in a wide variety of incidents and indications.

The pharmaceutical company DaLyn has, in accordance with its mission of improvement of life quality by , supplying, and developing the highest quality drugs and skin products, and by observing the highest international standards which guarantee the quality of products and environmental protection, enriched its pharmaceutical range of medical device products (drugs issued without a medical prescription) by a modern medical device with the proprietary name skincol .

It is a advance wound product on the market, of top-quality and exceptional efficiency, which is intended for the local treatment of leg ulcers, diabetic ulcers, decubitus ulcer, as well as for rapid and efficient healing of skin impairments such as scratches, cuts and other uninfected wounds, burns and skin cracks.

SKINCOL is a medical device whose mechanism of action is based on physical properties of sucralfate, an active ingredient of this product. In contact with the damaged skin, sucralfate forms a protective barrier covering the damaged area of the skin.

It is known that sucralfate, in the form of tablets and suspension, has been administered for decades in the treatment of stomach and duodenal ulcers. In these pharmaceutical forms, sucralfate lines stomach and duodenal mucosae by forming a protective covering epithelium on the surface of damaged tissue.

As compared to the stated, traditional forms of sucralfates, SKINCOL has a much greater capacity of adhering to damaged skin epithelium and its action is not dependent on the degree of skin acidity, i.e. pH value of the skin.

SKINCOL , being a special, highly efficient formulation in the form of cream and spray, enables a prolonged contact with the damaged skin and a long-lasting effect. Efficient renewal of the damaged skin and efficient healing of uninfected wounds of different origin have been proven by clinical studies.

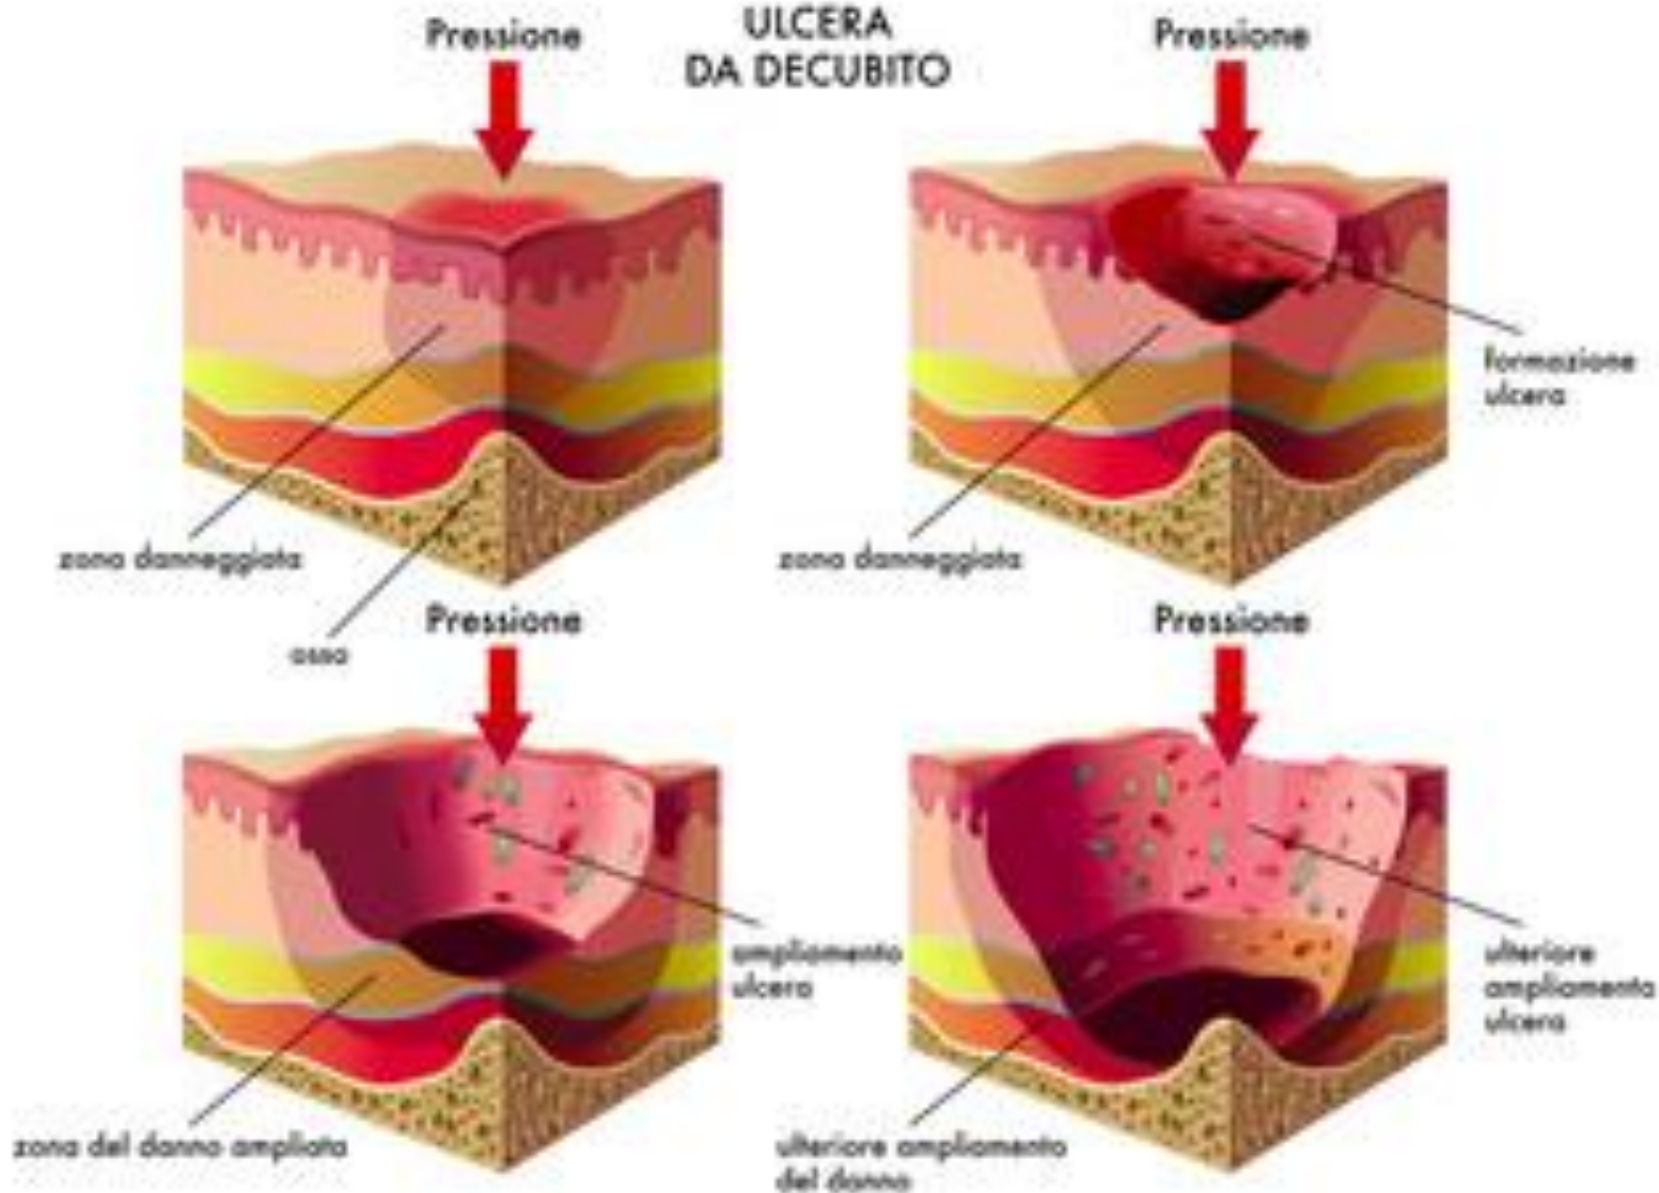

As a unique product on the market, SKINCOL offers to doctors a number of advantages in the treatment and curing of different skin impairments in patients, such as exceptional speed and efficiency of damaged skin's renewal.

One of the advantages is also improved quality for patients who by simple application as a part of self treatment, can achieve excellent results in terms of a complete renewal of damaged skin and significantly lesser possibility of scar occurrence which even in slight skin impairments such as scratches, cuts etc, represent an esthetic problem which everyone wants to get rid of as soon as possible.

Renews rapidly damaged skin and reduces the possibility of scar occurrence

Skincol is indicated in the treatment of leg ulcers, diabetic ulcers, decubitus ulcer as well as for rapid and efficient healing of scratches, cuts and other uninfected wounds, burns ,radio dermatitis and skin cracks

# ULCERA DA DECUBITO

DIABETIC PATIENT WITH ULKER AND

# skincol

Unique product for rapid healing of the skin  
Efficient skin renewal, lesser possibility of  
the occurrence of scars

SKINCOL is a completely unique product on the market which can satisfaction the doctors, patients and all citizens who would like by self-treatment to rapidly and efficiently cure skin impairments such as scratches, cuts, burns and other uninfected wounds, as well as skin cracks.

What is actually SKINCOL ?

skincol is a modern top quality medical device , containing sucralfate 25% (aluminum salt of sucrose sucralfate) which in contact with the damaged skin, forms a protective layer which covers the damaged area on the skin and rapidly and efficiently acts on skin healing, preventing thus the occurrence of an infection. skincol is characterized by a great capacity of adherence to damaged epithelium, and a prolonged action which is independent of the skin acidity, i.e. the skin's pH value. All this makes it extremely suitable for self-treatment, i.e. efficient curing of various skin impairments

How is SKINCOL applied?

skincol is recommended to everyone who wants to achieve rapid results in renewing damaged skin and minimize the possibility of scar occurrence. This new product is also characterized by a very simple application-it is sufficient to apply it only once or daily. In the self-treatment of various skin impairments, this makes it an easy-to-use and convenient preparation for everyone who wants to achieve a maximum effect with minimum adverse reactions, which is after all, a characteristic of all top-quality self treatment products in the world (the so called OTC products – drugs and medical preparations obtained without a medical

Product's top-quality, safety and efficiency  
An efficient renewal of damaged skin and  
healing of uninfected wounds of different origin  
has been proven in a series of clinical studies  
performed in all over the world medical centers.
